## PDF Lab Guide

You may find it easier to download and follow the PDF version of the [Raspberry Pi, Python, Azure IoT Central, and Docker Container Debugging](#) hands-on lab guide.

## Introduction

In this hands-on lab, you will learn how to create an Internet of Things (IoT) Python application with [Visual Studio Code](#), run it in a Docker Container on a Raspberry Pi, read the temperature, humidity, and air pressure telemetry from a BME280 sensor, then attach, and debug the Python code running in the container.

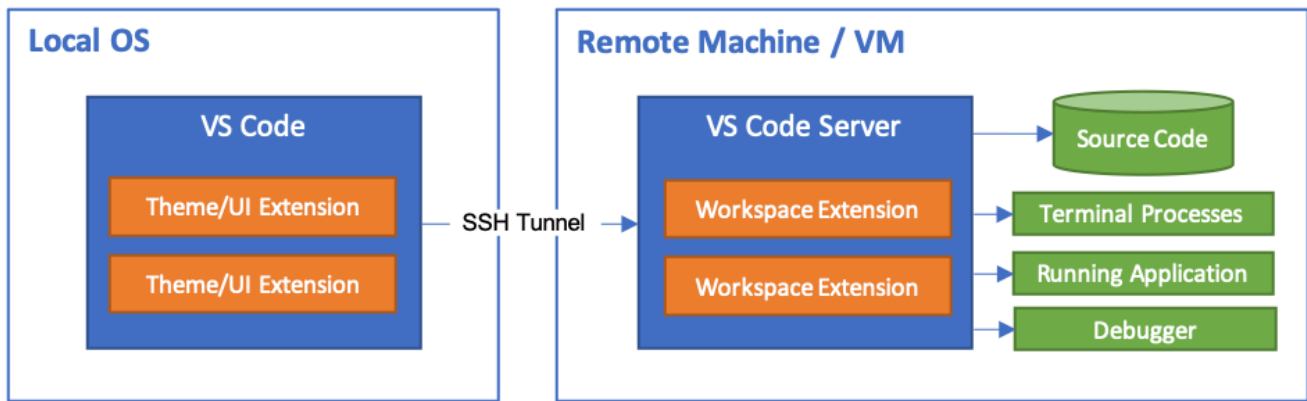

## References

- [Visual Studio Code](#)
- [Azure IoT Central](#)
- [Installing Docker on Raspberry Pi Buster](#)
- [Understanding Docker in 12 Minutes](#)

## Remote Development using SSH

The Visual Studio Code Remote - SSH extension allows you to open a remote folder on any remote machine, virtual machine, or container with a running SSH server and take full advantage of Visual Studio Code's feature set. Once connected to a server, you can interact with files and folders anywhere on the remote filesystem.

No source code needs to be on your local machine to gain these benefits since the extension runs commands and other extensions directly on the remote machine.

## CircuitPython

[CircuitPython](#), an [Adafruit](#) initiative, is built on the amazing work of Damien George and the MicroPython community. CircuitPython adds hardware support for Microcontroller development and simplifies some aspects of MicroPython. MicroPython and by extension, CircuitPython implements version 3 of the Python language reference. So, your Python 3 skills are transferrable.

CircuitPython runs on over 60 **Microcontrollers** as well as the **Raspberry Pi**. This means you build applications that access GPIO hardware on a Raspberry Pi using CircuitPython libraries.

The advantage of running CircuitPython on the Raspberry Pi is that there are powerful Python debugging tools available. If you have ever tried debugging applications on a Microcontroller, then you will appreciate it can be painfully complex and slow. You resort to print statements, toggling the state of LEDs, and worst case, using specialized hardware.

With Raspberry Pi and CircuitPython, you build and debug on the Raspberry Pi, when it is all working you transfer the app to a CircuitPython Microcontroller. You need to ensure any libraries used are copied to the Microcontroller, and pin mappings are correct. But much much simpler!

This hands-on lab uses CircuitPython libraries for GPIO, I2C, and the BME280 Temperature/Pressure/Humidity sensor. The CircuitPython libraries are installed on the Raspberry Pi with pip3.

```
pip3 install adafruit-blinka adafruit-circuitpython-bme280
```

# Software Installation

This hands-on lab uses Visual Studio Code. Visual Studio Code is a code editor and is one of the most popular **Open Source** projects on GitHub. It runs on Linux, macOS, and Windows.

Install:

1. [Visual Studio Code Insiders Edition](#)

As at August 2019, **Visual Studio Code Insiders Edition** is required as it has early support for Raspberry Pi and Remote Development over SSH.

2. [Remote - SSH Visual Studio Code Extension](#)
3. [Docker Extension](#)

For information on contributing or submitting issues see the [Visual Studio GitHub Repository](#).

Visual Studio Code documentation is also Open Source, and you can contribute or submit issues from the [Visual Studio Documentation GitHub Repository](#).

## Raspberry Pi Hardware

If you are attending a workshop, then you can use a shared network-connected Raspberry Pi. You can also use your own network-connected Raspberry Pi for this hands-on lab.

### Shared Raspberry Pi

If you are attending a workshop and using a shared Raspberry Pi, then you will need the following information from the lab instructor.

1. The **Network IP Address** of the Raspberry Pi
2. Your assigned **login name** and **password**.

# Personal Raspberry Pi

If you are using your own network-connected Raspberry Pi, then you need:

1. The Raspberry Pi **Network IP Address**, the **login name**, and **password**.
2. You need to run the following commands on your Raspberry Pi to set two environment variables required for the hands-on lab.

```
echo "export LAB_PORT=\$(shuf -i 5000-8000 -n 1)" >> ~/.bashrc
echo "export LAB_HOST=\$(hostname -I | cut -d' ' -f 1)" >> ~/.bashrc
source ~/.bashrc
```

## SSH Authentication with private/public keys

Setting up a public/private key pair for [SSH](#) authentication is a secure and fast way to authenticate from your computer to the Raspberry Pi. This is needed for this hands-on lab.

## SSH for Linux and macOS

From a Linux or macOS **Terminal Console** run the following commands:

1. Create your key. This is typically a one-time operation. **Take the default options.**

```
ssh-keygen -t rsa -b 4096 -f ~/.ssh/id_rsa_python_lab
```

2. Copy the public key to the Raspberry Pi.

```
ssh-copy-id -i ~/.ssh/id_rsa_python_lab <login@Raspberry IP Address>
```

For example:

```
ssh-copy-id -i ~/.ssh/id_rsa_python_lab dev99@192.168.1.200
```

3. Test the SSH Authentication Key

```
ssh -i ~/.ssh/id_rsa_python_lab <login@Raspberry IP Address>
```

A new SSH session will start. You should now be connected to the Raspberry Pi **without** being prompted for the password.

4. Close the SSH session. In the SSH terminal, type exit, followed by ENTER.

## SSH for Windows 10 (1809+) Users with PowerShell

1. Start PowerShell as Administrator and install OpenSSH.Client

```
Add-WindowsCapability -Online -Name OpenSSH.Client
```

2. **Exit** PowerShell

3. Restart PowerShell (**NOT** as Administrator)

4. Create an SSH Key

```
ssh-keygen -t rsa -f $env:userprofile\.ssh\id_rsa_python_lab
```

5. Copy SSH Key to Raspberry Pi

```
cat $env:userprofile\.ssh\id_rsa_python_lab.pub | ssh `
<login@Raspberry IP Address> `
"mkdir -p ~/.ssh; cat >> ~/.ssh/authorized_keys"
```

6. Test the SSH Authentication Key

```
ssh -i $env:userprofile\.ssh\id_rsa_python_lab <login@Raspberry IP Address>
```

A new SSH session will start. You should now be connected to the Raspberry Pi **without** being prompted for the password.

7. Close the SSH session. In the SSH terminal, type exit, followed by ENTER.

## SSH for earlier versions of Windows

[SSH for earlier versions of Windows](#)

# Trouble Shooting SSH Client Installation

- [Remote Development using SSH](#)
- [Installing a supported SSH client](#)

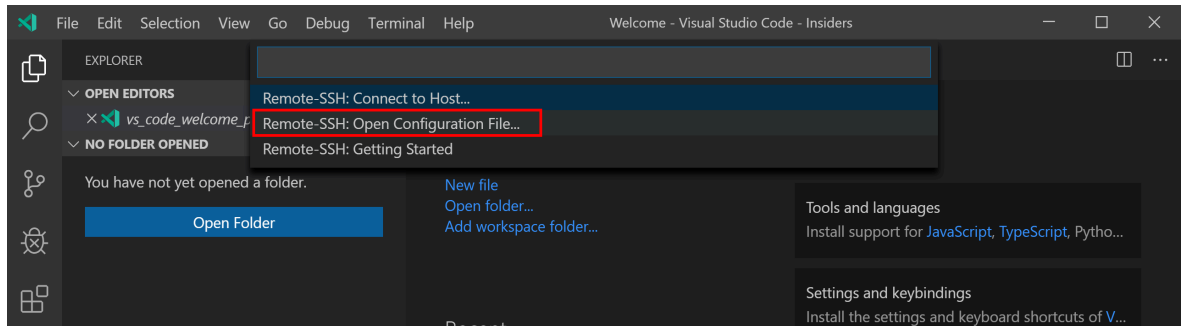

## Configure Visual Studio Code Remote SSH Development

Configure Visual Studio Code **Remote SSH** with the Raspberry Pi **Network IP Address**, **login name**, and **SSH key file** you will be using for the hands-on lab.

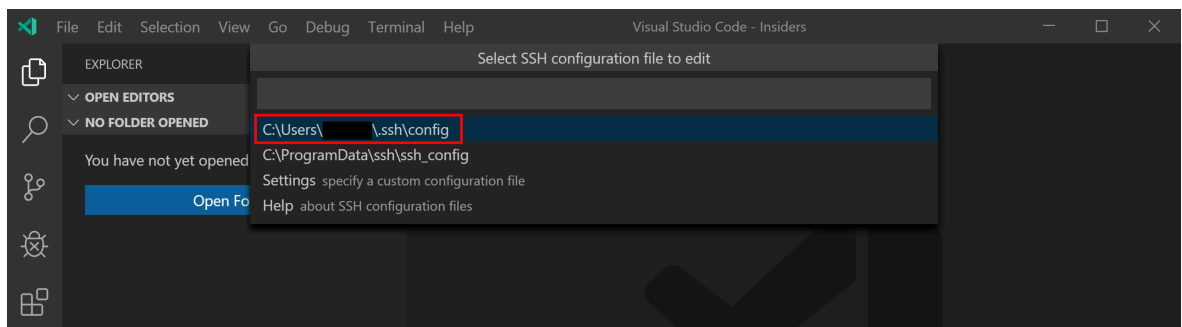

1. Start Visual Studio Code Insiders Edition
2. Click the **Open Remote Windows** button. You will find this button in the bottom left-hand corner of the Visual Studio Code window.

3. Select **Open Configuration File**

4. Select the user `.ssh` config file

5. Set the SSH connection configuration. You need the Raspberry Pi **IP Address**, the Raspberry Pi **login name**, and finally set the **IdentityFile** field to `~/ssh/`

**id\_rsa\_python\_lab**. Save these changes (Ctrl+S).

6. Click the Open Remote Windows button (bottom left) then select **Remote SSH: Connect to Host**

7. Select the host **RaspberryPi** configuration

It will take a moment to connect to the Raspberry Pi.

## Install the Python Visual Studio Code Extension

Launch Visual Studio Code Quick Open (Ctrl+P), paste the following command, and press enter:

```
ext install ms-python.python
```

See the [Python Extension](#) page for information about using the extension.

# Open the Lab2 Docker Debug Project

From **Visual Studio Code**, select **File** from the main menu, then **Open Folder**. Navigate to and open the **github/lab2-docker-debug** folder.

1. From VS Code: File -> Open Folder, navigate to **github/lab2-docker-debug**.
2. Expand the App folder and open the [app.py](#) file.

## Creating an Azure IoT Central Application

We are going to create an Azure IoT Central application, then a device, and finally a device **connection string** needed for the application that will run in the Docker container.

As a *builder*, you use the Azure IoT Central UI to define your Microsoft Azure IoT Central application. This quickstart shows you how to create an Azure IoT Central application that contains a sample *device template* and simulated *devices*.

## Create a New IoT Central Application

1. Open the [Azure IoT Central](#) in a new browser tab, then click **Getting started**.
2. Next, you'll need to sign with your **Microsoft** Personal, or Work, or School account. If

you do not have a Microsoft account, then you can create one for free using the **Create one!** link.

## Sign in

to continue to Azure IoT Central

Email, phone, or Skype

---

[Can't access your account?](#)

No account? [Create one!](#)

Next

3. Create a new Azure IoT Central application, select **New Application**. This takes you to the **Create Application** page.
4. Select **Trail, Custom application**, name your IoT Central application and complete the sign-up information.

## Choose a payment plan

<input checked="" type="radio"/> Trial	<input type="radio"/> Pay-As-You-Go
Free trial for 7 days. No subscription required.	Price is based on the number of devices you use. Free for the first 5 devices. Subscription required. <a href="#">Learn more</a>

## Select an application template

<input type="radio"/> Sample Contoso	<input type="radio"/> Sample Devkits	<input checked="" type="radio"/> Custom application
Get started with a predefined application for a connected device.	Want to connect a Raspberry PI or MXChip IoT DevKit? Start with this predefined app and get them connected in minutes.	Start with a blank template and define your application from scratch.

4. Click **Create Device Templates**, then select the **Custom** template, name your template, for example, **Raspberry**. Then click Create

5. Edit the Template, add **Measurements** for **Temperature**, **Humidity**, and **Pressure** telemetry.

Measurements are the data that comes from your device. You can add multiple measurements to your device template to match the capabilities of your device.

- **Telemetry** measurements are the numerical data points that your device collects over time. They're represented as a continuous stream. An example is temperature.
- **Event** measurements are point-in-time data that represents something of significance on the device. A severity level represents the importance of an event. An example is a fan motor error.
- **State** measurements represent the state of the device or its components over a period of time. For example, a fan mode can be defined as having Operating and Stopped as the two possible states.
- **Location** measurements are the longitude and latitude coordinates of the device over a period of time in. For example, a fan can be moved from one location to another.

Use the information in the following table to set up three telemetry measurements.

The field name is case-sensitive.

You **must** click **Save** after each measurement is defined.

Display Name	Field name	Units	Minimum	Maximum	Decimals
Humidity	Humidity	%	0	100	0
Temperature	Temperature	degC	-10	60	0
Pressure	Pressure	hPa	800	1260	0

The following is an example of setting up the **Temperature** telemetry measurement.

6. Click **Device** on the sidebar menu, select the **Raspberry** template you created. IoT central supports real devices, such as the Raspberry Pi used for this lab, as well as simulated devices which generate random data useful for system testing.
7. Select **Real**.

Name your **Device ID** so you can easily identify the device in the IoT Central portal, then click **Create**.

Create New Device

Device ID \* ⓘ

raspberrypi-01

Device Name ⓘ

Raspberry - raspberrypi-01

Create

Cancel

8. When you have created your real device click the **Connect** button in the top right-hand corner of the screen to display the device credentials.

Close

## Generate an Azure IoT Hub Connection String

1. Hold the control key down and click the following link [Connection String Generator](#) to open in a new tab.  
Copy and paste the **Scope Id**, **Device Id**, and the **Primary Key** from the Azure IoT Central Device Connection panel to the Connection String Generator page and click **Get Connection String**.

## Azure IoT Central Connection String Generator

Scope	01e00000-0000-0000-0000-000000000000
Device Id	my-device
Device Key	UzZtjCwmxQ...aszy5RAn/j+bSEfEjBW7w3V145lp/c=

Get Connection String

2. Copy the generated connection string to the clipboard as you will need it for the next step.

## Open the Visual Studio Code Docker Debugging Lab

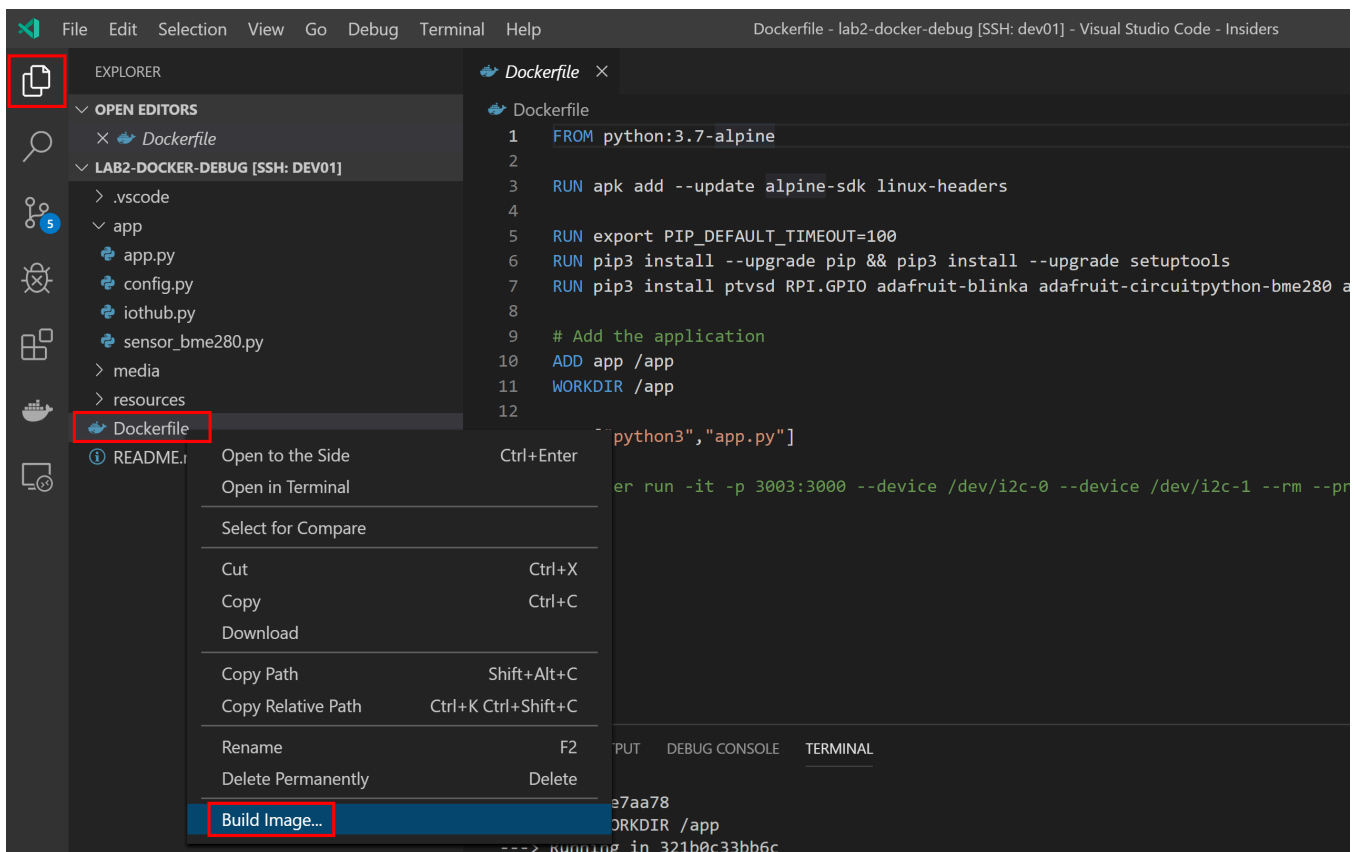

### Build the Docker Image

1. Switch back to the project you opened with Visual Studio Code. Open the **env-file** (environment file). This file will contain environment variables that will be passed into the Docker container.
2. Paste the connection string you copied in the previous step into the env-file on the same line, and after **CONNECTION\_STRING=**.

For example:

```
CONNECTION_STRING=HostName=saas-iothub-8135cd3b....
```

3. Save the env-file file (Ctrl+S)
4. Ensure **Explorer** selected in the activity bar, right mouse click file named **Dockerfile** and select **Build Image**.

5. Give your docker build image a **unique name** - eg the first part of your email address, your nickname, something memorable, followed by **:latest**. The name needs to be unique otherwise it will clash with others building Docker images on the same Raspberry Pi.

For example **glovebox:latest**

## Run the Docker Image

Paste these commands into the Visual Studio Code Terminal Window. You can open a new Terminal Window with **Ctrl+Shift+`**

```
13 CMD ["python3","app.py"]
14
15 # docker run -it -p 3003:3000 --device /dev/i2c-0 --device /dev/i2c-1 --rm --privileged lab2-docker:latest
```

PROBLEMS OUTPUT DEBUG CONSOLE **TERMINAL** 3: Docker ▼

```
dev01@rpi4bpplus:~/github/lab2-docker-debug $ IMAGE_NAME=glovebox:latest
```

1. Set the IMAGE\_NAME environment variable. This is the unique name you used when you built the Docker Image.

```
export IMAGE_NAME=<YOUR-UNIQUE-NAME>:latest
```

2. Display and make a note of your \$LAB\_PORT environment variable. This is set in the .bashrc file. You will need this for the debugger step.

```
echo -e "\e[7mYour Lab Port is $LAB_PORT\e[0m"
```

3. Start the Docker Container

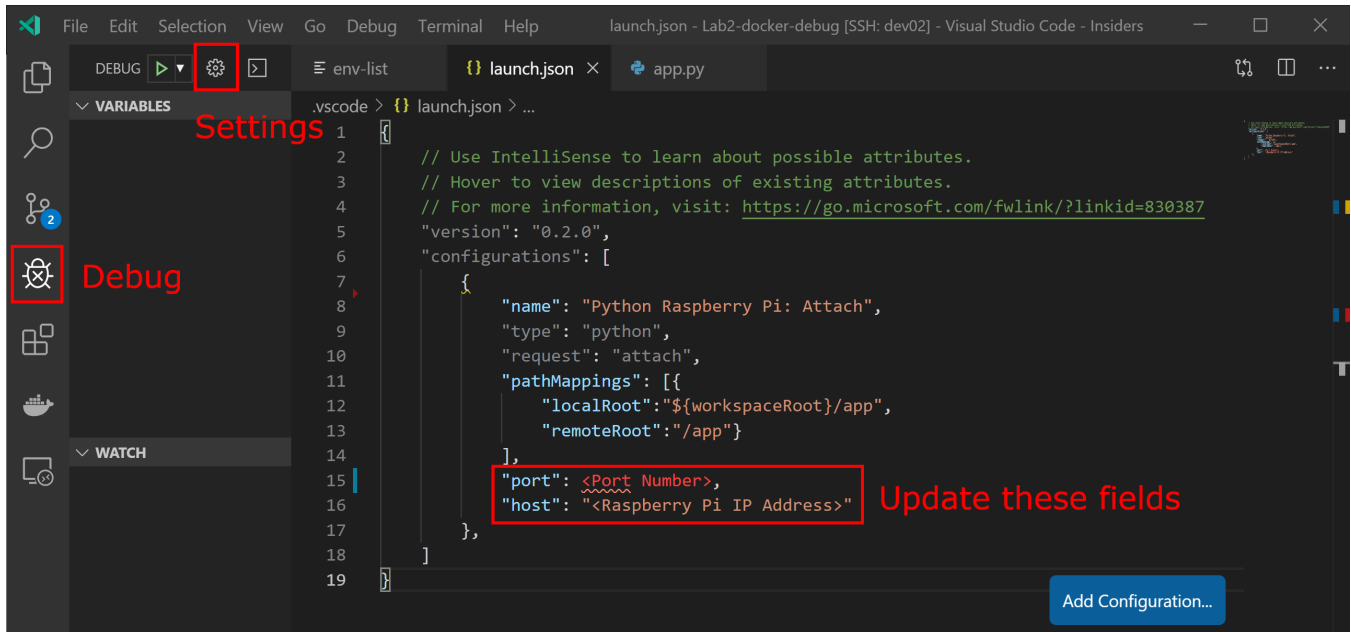

```
docker run -it \  
-p $LAB_PORT:3000 \  
-e TELEMETRY_HOST=$LAB_HOST \  
--env-file ~/github/Lab2-docker-debug/env-list \  
--device /dev/i2c-0 --device /dev/i2c-1 \  
--rm --privileged $IMAGE_NAME
```

The **Docker run** will start your container in interactive mode (**--it**), (**-p**) will map the **\$LAB\_PORT** to port 3000 in the container, the BME280 sensor is connected to the host **I2C** bus, (**--device**) maps the host I2C bus into the container, (**--rm**) removes the container when you stop it, (**--privileged**) grants elevated permissions to the container so that it can access the host I2C bus from within the container, and finally Docker starts the image you built/named.

## Configure the Visual Studio Code Debugger

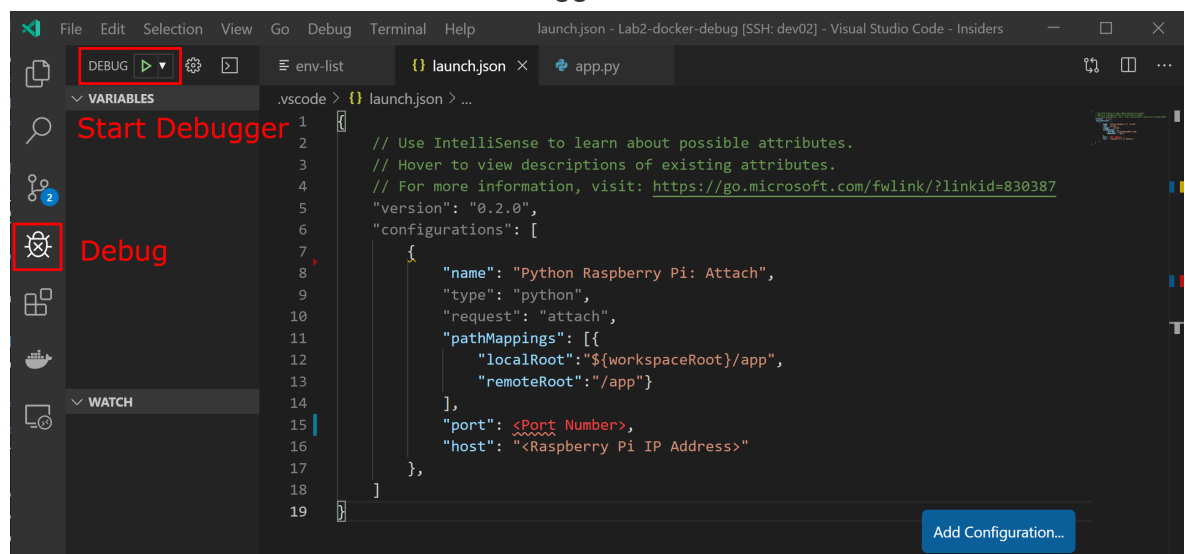

1. Click **Debug** on the Visual Studio activity bar.

2. Clicking **Settings**
3. Update the **port** value to the **Port Number** displayed when you started the Docker Container in the Visual Studio Terminal Window.
4. Update the **host** to match your Raspberry Pi IP Address.

## Attach the Debugger to the Docker Container

1. Click **Debug** on the Visual Studio activity bar.
2. Click the **Debug Selection** dropdown, and ensure **Python Raspberry Pi: Attach** is selected.
3. Click the **Run** button to attach the debugger.

4. From **Explorer** on the Visual Studio Code activity bar, open the **app.py** file
5. Set a breakpoint in the while True loop.

```
49 def publish():
50     while True:
51         try:
52             telemetry = mysensor.measure()
53             print(telemetry)
54             client.publish(iot.hubTopicPublish, telemetry)
55             time.sleep(sampleRateInSeconds)
```

Ensure the **app.py** file is open, set a breakpoint at line **64**, in the **publish** function (**telemetry = mysensor.measure()**) by doing any one of the following:

- With the cursor on that line, press F9, or,
- With the cursor on that line, select the Debug > Toggle Breakpoint menu command, or, click directly in the margin to the left of the line number (a faded red dot appears when hovering there). The breakpoint appears as a red dot in the left margin:

## Debugger Controls

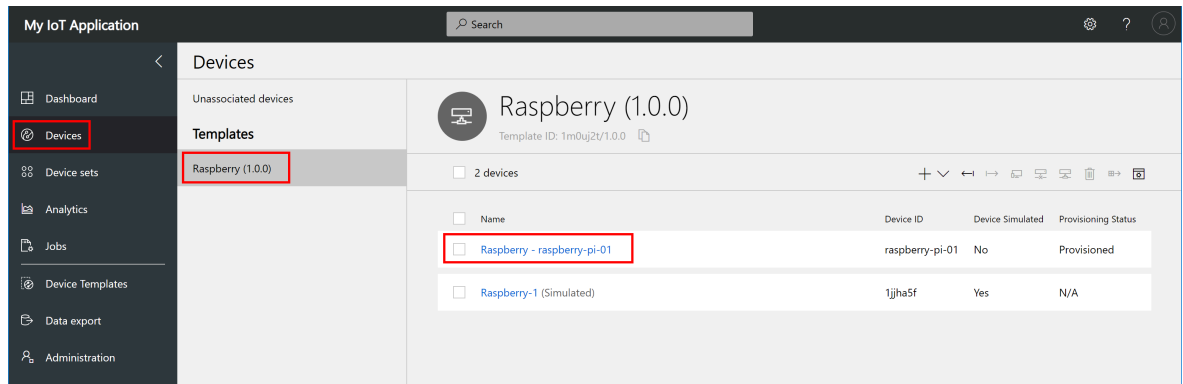

Debugger Controls allow for Starting, Pausing, Stepping in to, Stepping out off, restarting code, and finally Disconnecting the debugger.

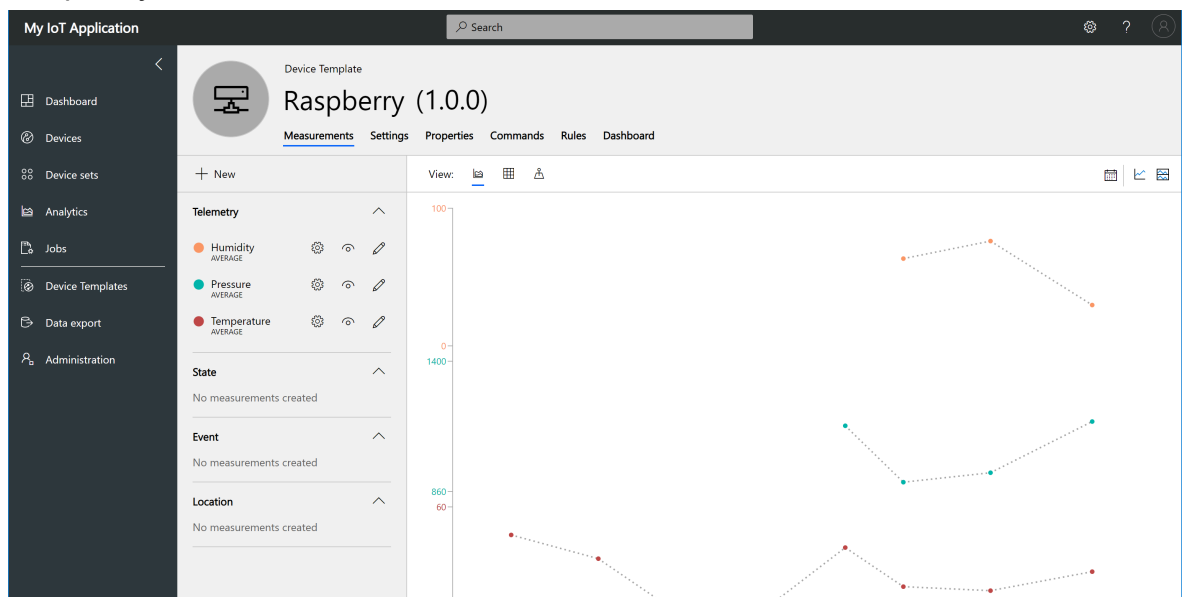

1. Explore the **Debug Console** (Ctrl+Shift+Y)
  1. With debugger stopped at the breakpoint in the **publish** function, explore the **Variables Window** and try typing **print(telemetry)** into the debug prompt.
2. Explore the **Terminal**
3. From the Debugger Toolbar, **Disconnect** the debugger so the application in the Docker container continues to run and stream telemetry to **Azure IoT Central**.

# Exploring Device Telemetry in Azure IoT Central

1. Use **Device** to navigate to the **Measurements** page for the real Raspberry Pi device you added:

2. On the **Measurements** page, you can see the telemetry streaming from the Raspberry Pi device:

## Finished

Complete. Congratulations

# Appendix

## Azure IoT Central

### Take a tour of the Azure IoT Central UI

This article introduces you to the Microsoft Azure IoT Central UI. You can use the UI to create, manage, and use an Azure IoT Central solution and its connected devices.

As a *builder*, you use the Azure IoT Central UI to define your Azure IoT Central solution. You can use the UI to:

- Define the types of device that connect to your solution.
- Configure the rules and actions for your devices.
- Customize the UI for an *operator* who uses your solution.

As an *operator*, you use the Azure IoT Central UI to manage your Azure IoT Central solution. You can use the UI to:

- Monitor your devices.
- Configure your devices.
- Troubleshoot and remediate issues with your devices.
- Provision new devices.

### Use the left navigation menu

Use the left navigation menu to access the different areas of the application. You can expand or collapse the navigation bar by selecting < or >:

## Menu

## Description

- The **Dashboard** button displays your application dashboard. As a builder, you can customize the dashboard for your operators. Users can also create their own dashboards.
- The **Device Explorer** button lists the simulated and real devices associated with each device template in the application. As an operator, you use the **Device Explorer** to manage your connected devices.
- The **Device Sets** button enables you to view and create device sets. As an operator, you can create device sets as a logical collection of devices specified by a query.
- The **Analytics** button shows analytics derived from device telemetry for devices and device sets. As an operator, you can create custom views on top of device data to derive insights from your application.
- The **Jobs** button enables bulk device management by having you create and run jobs to perform updates at scale.
- The **Device Templates** button shows the tools a builder uses to create and manage device templates.
- The **Continuous Data Export** button an administrator to configure a continuous export to other Azure services such as storage and queues.
- The **Administration** button shows the application administration pages where an administrator can manage application settings, users, and roles.

## Search, help, and support

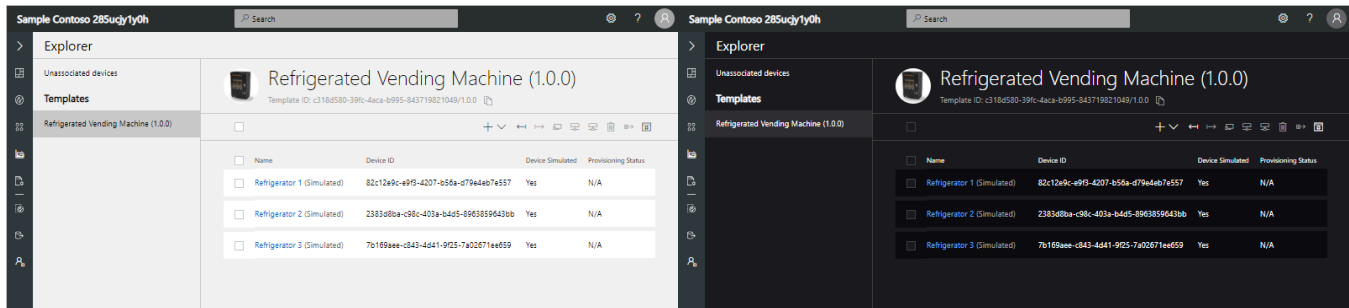

The top menu appears on every page:

- To search for device templates and devices, enter a **Search** value.
- To change the UI language or theme, choose the **Settings** icon.
- To sign out of the application, choose the **Account** icon.
- To get help and support, choose the **Help** drop-down for a list of resources. In a trial

application, the support resources include access to [live chat](#).

You can choose between a light theme or a dark theme for the UI:

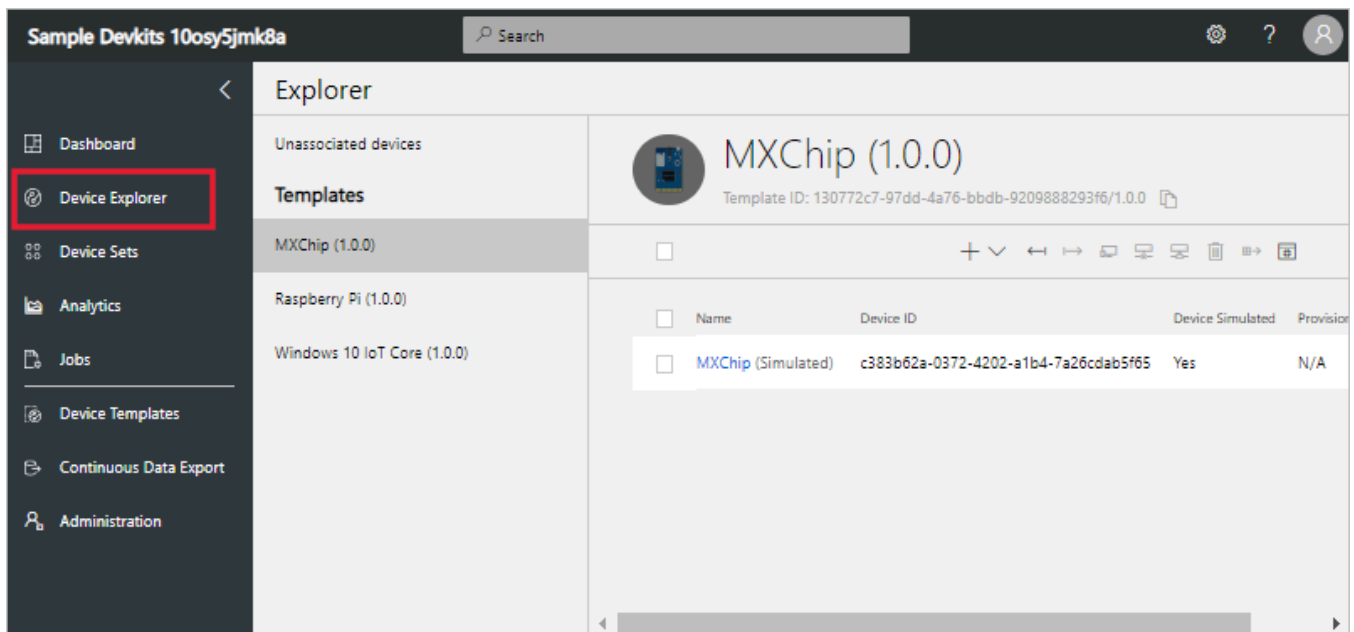

## Dashboard

The dashboard is the first page you see when you sign in to your Azure IoT Central application. As a builder, you can customize the application dashboard for other users by adding tiles. To learn more, see the [Customize the Azure IoT Central operator's view](#) tutorial. Users can also [create their own personal dashboards](#).

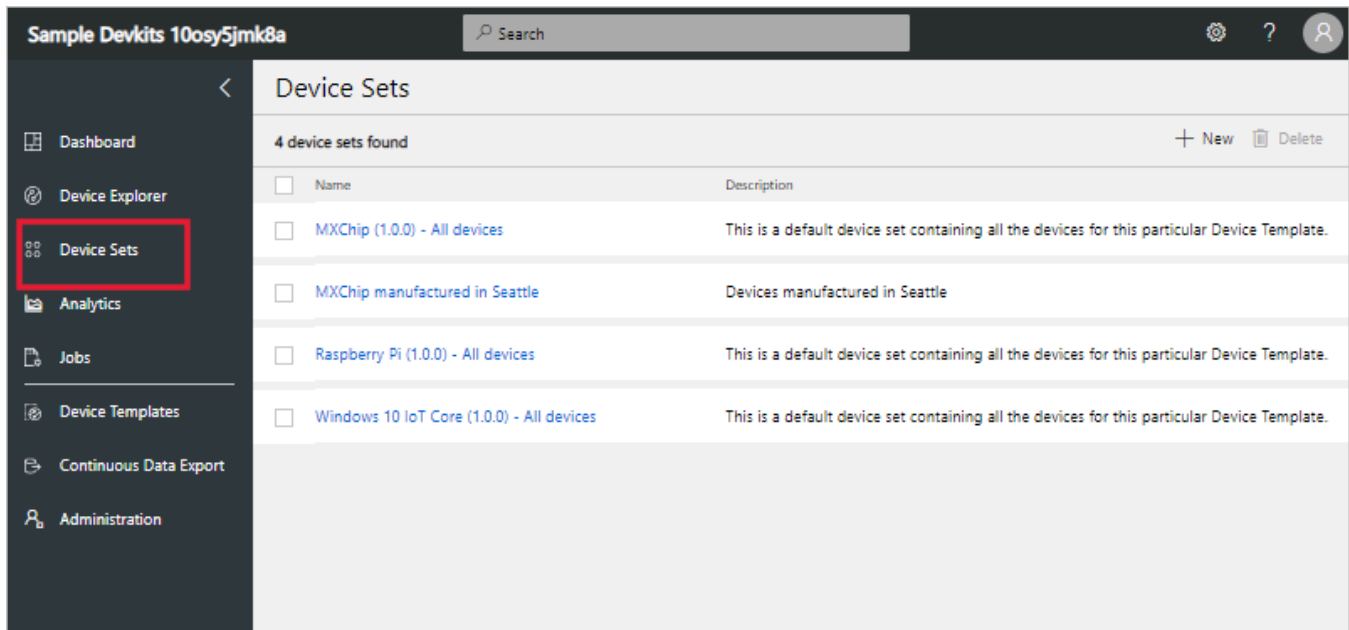

## Device explorer

The explorer page shows the *devices* in your Azure IoT Central application grouped by *device template*.

- A device template defines a type of device that can connect to your application. To learn more, see the [Define a new device type in your Azure IoT Central application](#).
- A device represents either a real or simulated device in your application. To learn more, see the [Add a new device to your Azure IoT Central application](#).

## Device sets

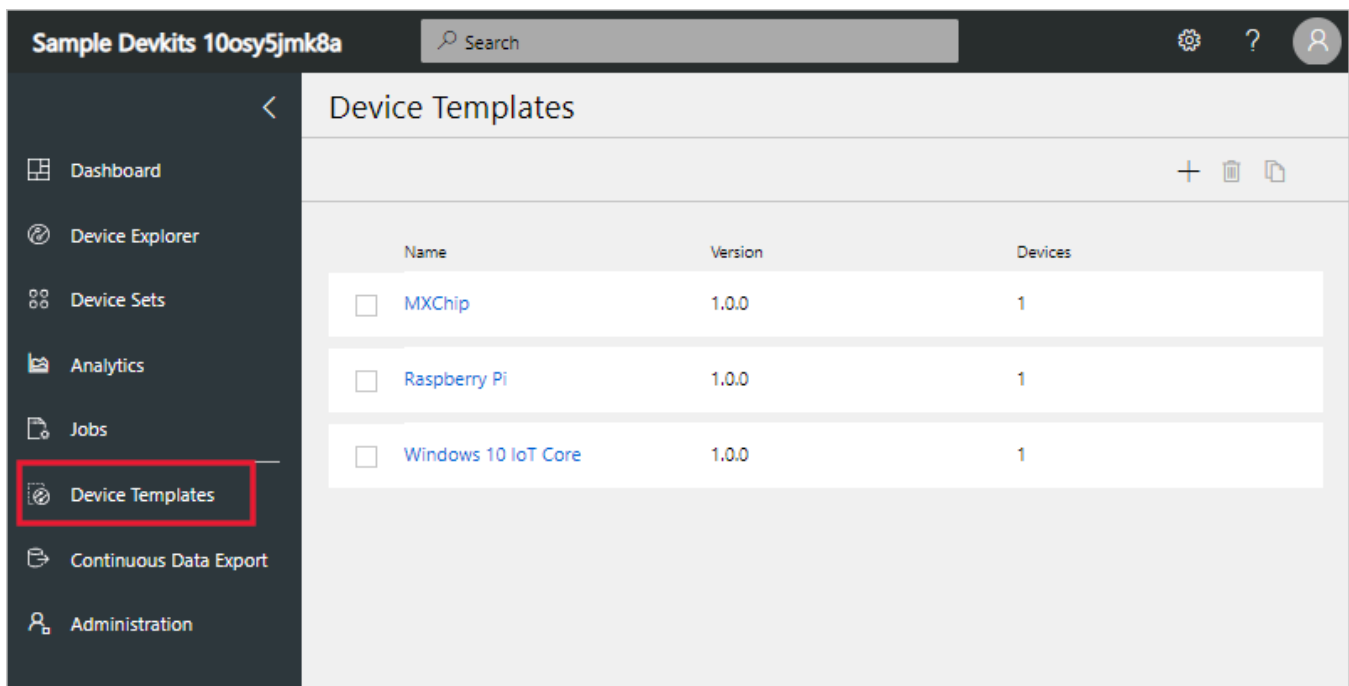

The screenshot shows the 'Device Sets' page in the Azure IoT Central interface. The left sidebar contains navigation links: Dashboard, Device Explorer, Device Sets (highlighted with a red box), Analytics, Jobs, Device Templates, Continuous Data Export, and Administration. The main content area is titled 'Device Sets' and shows '4 device sets found'. There are '+ New' and 'Delete' buttons. The table below lists the device sets:

<input type="checkbox"/>	Name	Description
<input type="checkbox"/>	MXChip (1.0.0) - All devices	This is a default device set containing all the devices for this particular Device Template.
<input type="checkbox"/>	MXChip manufactured in Seattle	Devices manufactured in Seattle
<input type="checkbox"/>	Raspberry Pi (1.0.0) - All devices	This is a default device set containing all the devices for this particular Device Template.
<input type="checkbox"/>	Windows 10 IoT Core (1.0.0) - All devices	This is a default device set containing all the devices for this particular Device Template.

The *device sets* page shows device sets created by the builder. A device set is a collection of related devices. A builder defines a query to identify the devices that are included in a device set. You use device sets when you customize the analytics in your application. To learn more, see the [Use device sets in your Azure IoT Central application](#) article.

## Device Templates

The screenshot shows the 'Device Templates' page in the Azure IoT Central interface. The left sidebar contains navigation links: Dashboard, Device Explorer, Device Sets, Analytics, Jobs, Device Templates (highlighted with a red box), Continuous Data Export, and Administration. The main content area is titled 'Device Templates' and shows a table with 3 device templates:

<input type="checkbox"/>	Name	Version	Devices
<input type="checkbox"/>	MXChip	1.0.0	1
<input type="checkbox"/>	Raspberry Pi	1.0.0	1
<input type="checkbox"/>	Windows 10 IoT Core	1.0.0	1

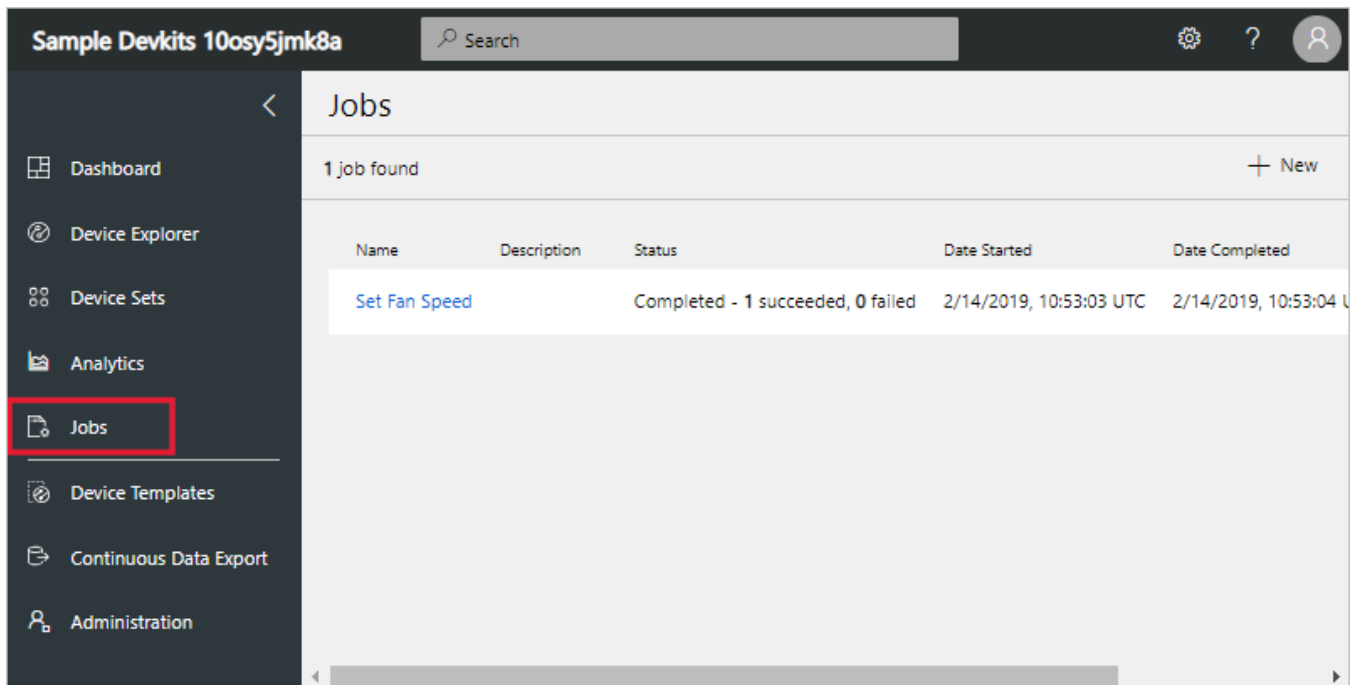

The device templates page is where a builder creates and manages the device templates in the application. To learn more, see the [Define a new device type in your Azure IoT Central application](#) tutorial.

## Analytics

The analytics page shows charts that help you understand how the devices connected to your application are behaving. An operator uses this page to monitor and investigate issues with connected devices. The builder can define the charts shown on this page. To learn more, see the [Create custom analytics for your Azure IoT Central application](#) article.

## Jobs

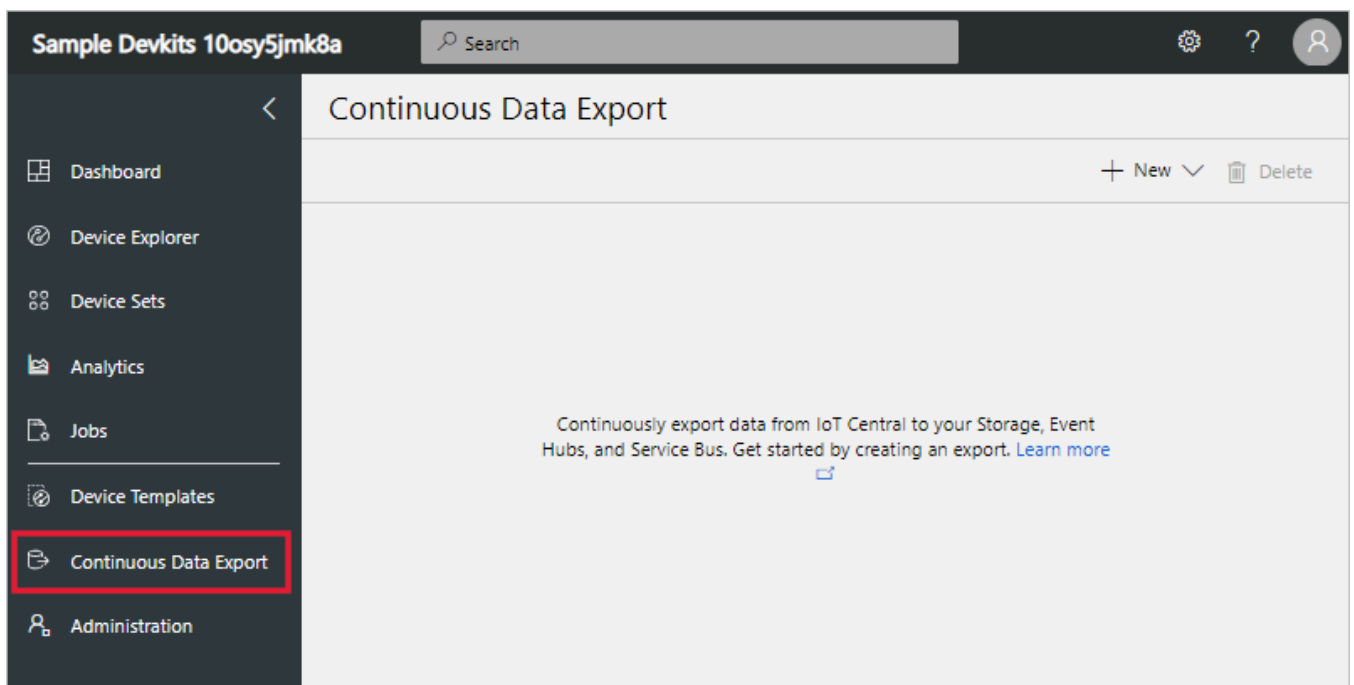

The screenshot shows the 'Jobs' page in the IoT Central interface. The left sidebar contains a navigation menu with items: Dashboard, Device Explorer, Device Sets, Analytics, Jobs (highlighted with a red box), Device Templates, Continuous Data Export, and Administration. The main content area is titled 'Jobs' and shows '1 job found'. A table lists the job details:

Name	Description	Status	Date Started	Date Completed
Set Fan Speed		Completed - 1 succeeded, 0 failed	2/14/2019, 10:53:03 UTC	2/14/2019, 10:53:04 UTC

At the top right of the main content area, there is a '+ New' button.

The jobs page allows you to perform bulk device management operations onto your devices. The builder uses this page to update device properties, settings, and commands. To learn more, see the [Run a job](#) article.

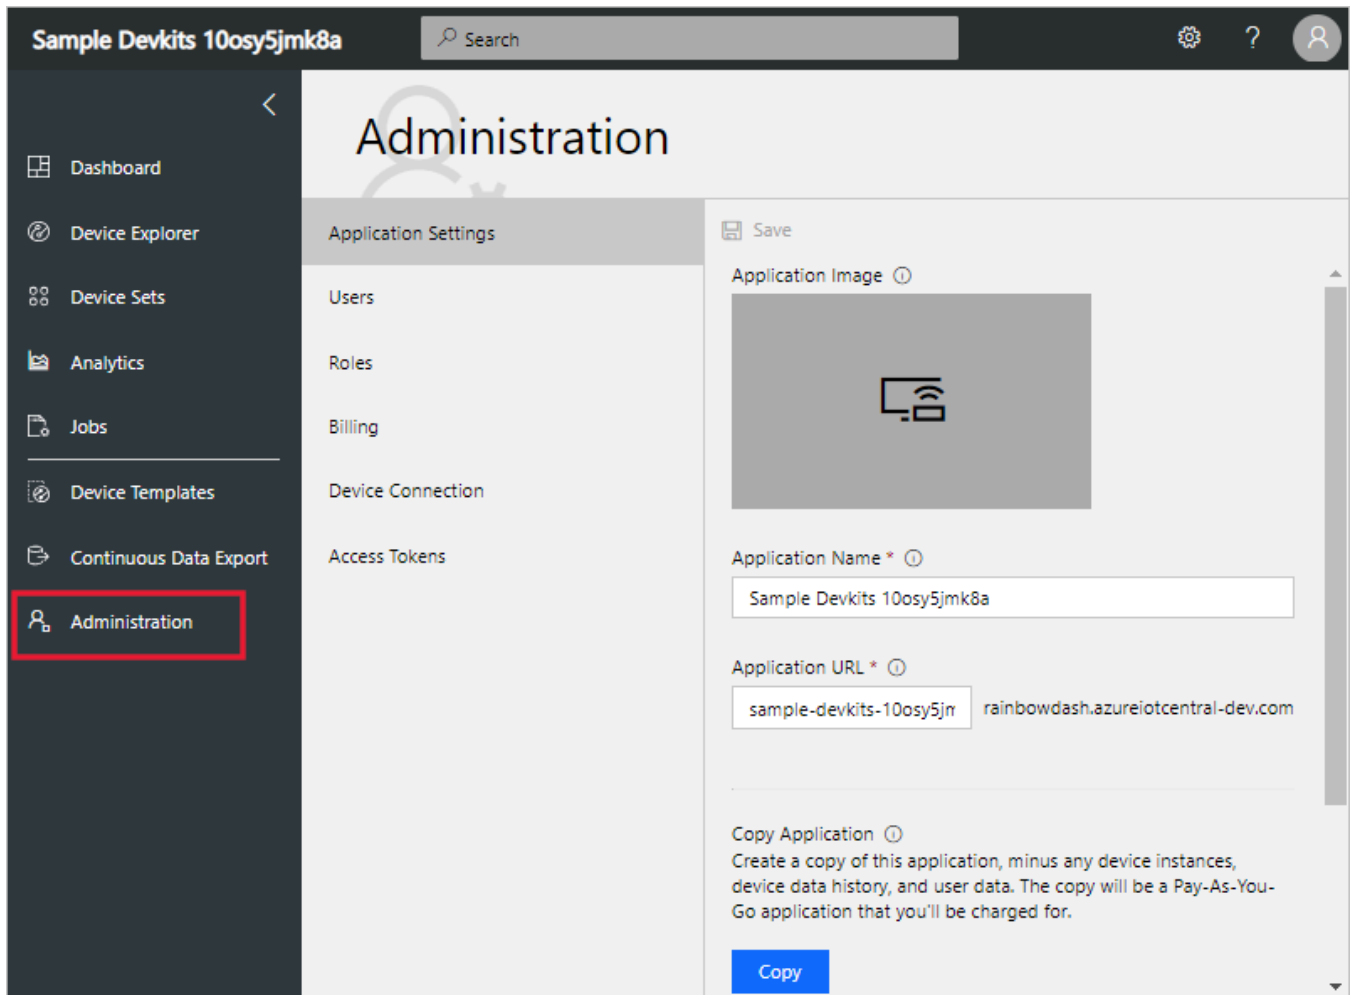

## Continuous Data Export

The screenshot shows the 'Continuous Data Export' page in the IoT Central interface. The left sidebar contains a navigation menu with items: Dashboard, Device Explorer, Device Sets, Analytics, Jobs, Device Templates, Continuous Data Export (highlighted with a red box), and Administration. The main content area is titled 'Continuous Data Export' and shows '+ New' and 'Delete' buttons. Below the buttons, there is a message: 'Continuously export data from IoT Central to your Storage, Event Hubs, and Service Bus. Get started by creating an export. [Learn more](#)'.

The continuous data export page is where an administrator defines how to export data, such as telemetry, from the application. Other services can store the exported data or use it for analysis. To learn more, see the [Export your data in Azure IoT Central](#) article.

## Administration

The administration page contains links to the tools an administrator uses such as defining users and roles in the application. To learn more, see the [Administer your Azure IoT Central application](#) article.
